

IAF Vista™ for Oracle9i OLAP

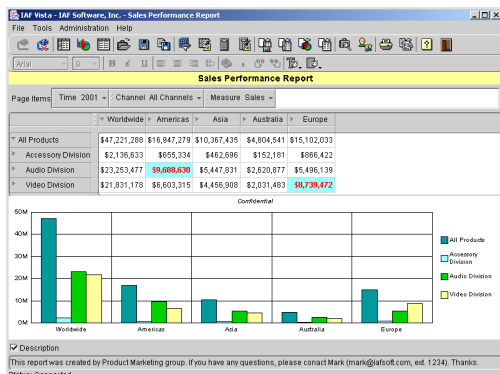

Easy-to-use BI Application Tool

For a BI application to be truly effective, business users – a term we use to describe analysts, managers, executives and anyone who needs to interpret data as part of their job – must be able to use BI tools on their own, without support from the IT staff or systems analysts. They must also be able to distribute their analysis results quickly and easily. Unfortunately, most OLAP tools that are available on the market today are difficult to use without IT support and are only offered as a client-server option. IAF Vista™ replaces difficult-to-use BI tools with a robust BI application platform that enables business users to easily analyze corporate data and share it with any number of users via simple point-and-click Web distribution.

The Best BI Tool for Oracle9i OLAP

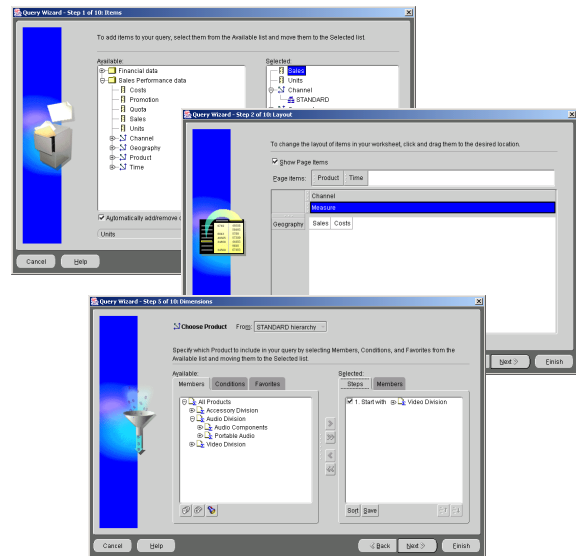

IAF Vista, a BI application tool developed using Oracle JDeveloper and BI Java Beans, extends the Oracle9i OLAP environment. It enables business users to analyze data as soon as an analytic model is built with Oracle Enterprise Manager or IAF Coaster.

IAF Vista crosstab-graph dual view

Rapid BI Application Development

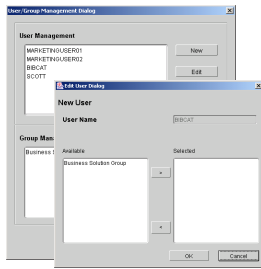

The IAF Vista wizard enables rapid point-and-click development of BI applications. It also allows step-by-step development of format items such as title, layout (cross tab, graph, cross tab/graph coordination), and initial data. These easily-created BI applications can be shared with others in the organization because reports are stored in the repository on the server and can be accessed by users who have been granted permission.

Developing OLAP applications with IAF Vista wizards

Sophisticated User Administration

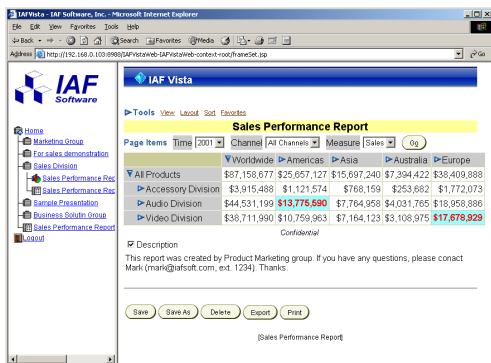

IAF Vista includes a powerful user administration function. Users can define limits on a referable BI application by user and group. User information is administered at the repository on the server as well as at the BI application level. In addition, a simple customization allows users to sign on together and collaborate on developing an application as a team.

IAF Vista user/group management

Web-Based OLAP Functions

All users can view and change the published reports from their Web browser. IAF Vista includes all the OLAP functions that business users have come to expect, including slice and dice, drill down, data retrieval (name list, hierarchy level, group, value, top ten/bottom ten, sort, graph), export to spread sheet, and printing. Modified reports can be saved as personal reports.

IAF Vista HTML version

[IAF Vista Main Features]

Analysis functions

- Creating and viewing presentations (Dual-view/Crosstab/Graph/Table)
- Drill-down/Drill-up
- Slicing and dicing
- Data Selection (Edit Query)
 - Items (measures)
 - Layout
 - Dimension
 - Hidden dimensions

Formatting (Edit Format)

- Data-driven format (Format rule)
- Title (Title/Sub title/Footnote)

- Style (Report template)
- Description
- Multiple graph formats
- Format (Header/Data area/Legend etc.)

Management functions

- Persistence object management (BI Explorer)
- User/group management
- Management of user privileges

Additional functions

- Export (csv/tab delimited)
- Print
